### Lab 3 Pre-Lab

1. What is the final value (in C++) of the following expression? -20
2. How would the following expression be written in C++?  $(2 * x + \text{pow}(3, 4))$
3. Implicit conversion is also known as data type coercion
4. Explicit type conversion is also known as type casting
5. List the preprocessor directive that must be included for cin and cout to be used in a C++ program `#include <iostream>`
6. Blank spaces or unseen control characters in a data file are referred to as whitespace
7. The `<<` in a cout statement is called the extraction operator
8. The `#include <iomanip>` is needed for formatted output
9. The `'\n'` is a special character that is an escape sequence in a string to do the same thing as endl, to go to the next line for output
