#### Pre Lab Reading 6.1

1. The word void proceeds the name of every function prototype and heading that does not return a value back into the calling routine.
2. Pass by reference indicates that a copy of the actual parameter is placed in memory instead of its corresponding formal parameter.
3. Actual parameters are found in the call to function.
4. A prototype must give the data type of its formal parameters and may give their name.
5. A & after a data type in the function heading and in the prototype indicates that the parameter will be passed by reference.
6. Functions that do not return a value are often called procedures in other programming languages.
7. Pass by value indicates that the location of an actual parameter, rather than just a copy of its value, is passed to the called function.
8. A call must have the name of its actual parameters and must not have the data type of those parameters.
9. Scope refers to the region of a program where a variable is "active".
10. Formal parameters are found in the function heading.
